	Determination of this BAC-end sequence was carried out as part of a
	collaboration with the European Drosophila Genome Project (EDGP) -
	http://www.edgp.ebi.ac.uk This Drosophila melanogaster BAC
	library (Dros BAC) was made by Alain Billaud at CEPH (Centre
	d'Etude du Polymorphisme Humain) with funding provided by a MRC
	project grant. The DNA was prepared from embryos by Alain Bucheton
	and Genevieve Payan. It has been constructed in the vector

C.I. 16155 (Mial3) plants were greenhouse grown in the R Wise lab at Iowa State University, Ames, IA; 7 day old green seedlings were challenged with isolate A27 (AvrMla13)
Of Blumeria graminis f. sp. hordei, and leaves were harvested 20 and 24 hr post-inoculation and snap frozen; uninoculated leaves were harvested 20 hr post-inoculation (Wei, Wise). In the TV Close lab at the University of California, Riverside, total RNA was prepared from each sample pool, equal quantities of all three RNA pools were combined, poly(A) RNA was purified from the mixture, one combined, poly(A) RNA was purified from the mixture, one excised to give pBluescript SK(-) cDNA phagemids (Choi, Close). Phagemids were plated and picked at the Clemson University Genomics Institute (CUG1) (Begum, Palmer, DNA Frisch, Atkins and Ming). Plasmid DNA preparations, DNA

CNS014J2 1025 bp DNA linear GSS 26-JUL-1999
Drosophila melanogaster genome survey sequence T7 end of BAC
BACN11111 of DrosBAC library from Drosophila melanogaster (fruit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Web: www.genoscope.ons.fr)
Determination of this BAC-end sequence was carried out as part of a collaboration with the European Drosophila Genome Project (EDGP) - http://www.edgp.ebi.ac.uk -. This Drosophila melanogaster BAC library (Dros BAC) was made by Alain Billaud at CEPH (Centre d'Etude du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    660 AIWIAIWIWIYACAITITITITITITITITITACAMIICRIWIAITIAIAITITITITITITITIA 719

// Jab host=EE. coli strain XL10-Gold, T1-resistant, F-"
// Clone lib="Mouse 10kb plasmid UUGC2M library"
// Clone lib="Mouse 10kb plasmid UUGC2M library"
// note="Vector: PWD42nv; Purified genomic DNA from M
musculus G57BL/6J (female was obtained from the Jackson
Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifica at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligonicleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gi|4/32114|gb|AR129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli XL10-Gold (Stratagene) cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Rm. 308, Biomedical Polymers Research Bldg., 20 S. 2030 E., SLC, UT

The library was provided by Dr. David Bird at North
Carolina State University, Raleigh, NC
(david_birdencsu.edu). The cDNA was made by using Dynabead
oligo-dT priming (Dynal). PCR based library using a
modified protocol from the SWART PCR cDNA Synthesis Kit
from Clontech. Directionally cloned into the UDG sites of

/note="Vector: pAD-GAL4; At 20-25% parasitemia, blood was collected from BALBACByJ mice infected with Py17XL parasites, and leukocytes removed by passage over microcystalline cellulose collumns. Total RNA was isolated using the guandidinium isothicovanate method, and mRNA isolated using oligo(dT)-cellulose chromatography. First strand cDNA synthesis was completed using a S0-base primer and reverse transcriptase in the presence of 5-methyl dCTP. After second strand synthesis, uneven termini were treated with Pfu DNA polymerase and EcoRI adaptors ligated to the blunt ends. The sample was cleaved with XhoI and separated on a Sephacryl S-500 column. Size-fractionated CDNA was precipitated and ligated to HybrizAP arms directionally wetge and ligated to HybrizAP arms directionally wetge and plasmid DNA excised from the HybriZAP vector and plasmid DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The present sequence is the 98kDa putative outer membrane protein from Chlamydia pneumoniae. The genomic sequence was amplified using two PCR primers. The 5' primer contains a NoI restriction site, a ribosome binding site, an initiation codom and a sequence close to the 5' end of the 98kDa putative outer membrane protein coding sequence. The 3' primer contains the sequence encoding the C-terminal sequence of the putative outer membrane protein and a Broil restriction site. The stop codon was excluded and an additional nucleotide was inserted to obtain an in-frame C-terminal fusion with the Histidine tag. The PCR product was cloned into a eukaryotic expression vector (pCA-Myc-His) by restricting both the vector and the PCR product with NoI and BamHl and performing a ligation reaction. This expression vector (pCA-Myc-His) by restricting both chlamydia pneumoniae. The chlamydial lung titers of the immunised mice were lower than those of the controls. Thus the 98kDa putative outer changed infections, especially chlamydia pneumoniae. The plamydial pneumoniae infections of the present polypeptide may also be administered orally to treat
                                                                                                                                                                                                                                                Novel Chlamydia 98 kDa putative outer membrane protein antigen, used for vaccination and protection against Chlamydia infection
                                                                                                                                                     Dunn PL;

2740 2800 2860 860 900 920 This polypeptide comprises the novel 90.0 kDa surface exposed protein Omp8 of the human respiratory pathogen Chlamydia protein Omp8 of the human respiratory pathogen Chlamydia protein Omp8 of the human acid sequence was deduced from DNA (see PAMX06820) isolated from a C. pneumoniae expression library. The invention provides 12 novel surface exposed proteins, Omp4-Omp15 (see PAM88417-28), and nucleic acid sequences encoding them (see PAM08417-28), and nucleic acid sequences encoding them (see C. pneumoniae. The test comprises detecting antibodies specific for one pneumoniae. The test comprises detecting antibodies specific for one pneumoniae. The test comprises detecting in mammals. The in the diagnosis of C. pneumoniae infection in mammals. The cucleic acids and proteins can also be used in the immunization of mammals, the nucleic acids being particularly useful as DNA vaccines for effecting in vivo expression of antigens. The 2741 AATTTGGCAAGACAAGCTTTAGTCCTTCGTGCAGGGAACCATTTTTGCTTTAACTCAAAT 2681 AACCCCGACTGTACGACAACACTGCGAATTAGCGGTGATTCTTGGAAAACCTTCGGTACG Species-specific test for identifying mammals infected with Chlamydia pneumoniae - comprises detecting antibodies specific for outer membrane proteins of C. pneumoniae or nucleic acids encoding Omp8; outer membrane protein 8; surface exposed protein; antigen; infection; diagnosis; vaccine; atherosclerosis; asthma. Madsen A; Chlamydia pneumoniae surface exposed protein Omp8. Knudsen K, Claim 7; Page 53-55; 115pp; English.

Sequences ABB90526-ABB90715 represent novel proteins from Chlamydia pneumoniae (strain CWL029), and ABL91184-ABL91373 represent DNA encoding them. The proteins are predicted to be immunogenic and may therefore be useful in vaccine production and for diagnostic purposes. Chlamydia pneumoniae is a common cause of respiratory disease in humans, and is also involved in the development of cardiovascular diseases such as also involved in the development of cardiovascular diseases such as also involved in the development of cardiovascular diseases such as a cardioration and stroke. The proteins and nucleic acids of the invention may be used in vaccines and pharmaceutical compositions for the prevention or treatment of chlamydial infections, particularly Chlamydia pneumoniae infections. The proteins may also be used in the detection of Chlamydia pneumoniae, and the nucleic acids may be used in PCR, branched CM prope assay or blotting techniques for determining Chlamydia pneumoniae expression. The present sequence represents a pneumoniae dene expression. The present sequence represents a specifically claimed Chlamydia pneumoniae protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AspSerGlyAlaAlaIlePheThrGluAlaSerValThrIleSerAsnAsnAlaLysVal

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         40
                                                                                                                                                                                                                                                                  AAY34584-Y35879 represent the proteins encoded by all the open reading frames in the complete genome (see AAX91990) of Chlamydia pneemmoniae. C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyagitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584-Y35879) can be used immunogenic compositions as vaccines. Vectors containing C. pneumoniae mucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae.
  Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope.

Its amino acid sequence was deduced from DNA (see AAX06817) isolated from a C pneumoniae expression library. The invention provides 12 novel surface exposed proteins, Omp4-Omp15 (see AAW88417-28), and mucleic acid sequences encoding them (see AAX06816-27). A new species specific test is claimed that is used to identify mammals (including humans) infected with Chlamydia pneumoniae. The test comprises detecting antibodies specific for

Omp4-Omp15 or detecting nucleic acid fragments encoding these outer membrane proteins, especially by PCR. The proteins are also used in the diagnosis of C. pneumoniae infection in mammals. The nucleic acids and proteins can also be used in the immunization of mammals, the nucleic acids being particularly useful as DNA vaccines for effecting in vivo expression of antigens. The vaccines may also prevent atherosclerosis and bronchial asthma, which are possibly associated with C. pneumoniae.

```

Dequences ABB90526-ABB90715 represent novel proteins from Chlamydia pneumoniae (strain CWL029), and ABL91184-ABL91373 represent DNA encoding them. The proteins are predicted to be immunogenic and may therefore be useful in vaccine production and for diagnostic purposes. Chlamydia pneumoniae is a common cause of respiratory disease in humans, and is also involved in the development of cardiovascular diseases such as also involved in the development of cardiovascular steases such as also involved in the development of cardiovascular steases such as also involved in farction, cerebrovascular disease, aortic aneurysm, claudication and stroke. The proteins and nucleic acids of the invention may be used in vaccines and pharmaceutical compositions for the prevention or treatment of chlamydial infections, particularly Chlamydia pneumoniae infections. The proteins may also be used in PCR, branched Chlamydia pneumoniae, and the nucleic acids may be used in PCR, branched DNA probe assay or blotting techniques for determining Chlamydia pneumoniae expression. The present sequence represents a pneumoniae chlamydia pneumoniae protein of the invention.

This sequence is a Chlamydia antigen of the invention, designated CPN100635. The nucleic acids (and their complementary sequences) may be used as diagnostic agents for detecting the presence of nucleic acids encoding Chlamydia antigens in samples according to standard methods, and therefore, for diagnosing Chlamydia infections. For example, they may be used as primers and probes for diagnostic polymerase chain reaction (PCR) assays. Antisense sequences may be used to down regulate expression of the proteins and may be used to treat infections. The nucleic acids may also be used to produce the protein artifers they encode according to standard recombinant DNA methodologies. The nucleic acids may also be used to produce the protein of artibodies (i.e. as vaccines) for preventing infection by Chlamydia. The antibodies may also be used as diagnostic reagents for detecting infections. Chlamydia is a pathogen implicated in the development of confict of for example) community acquired pneumonia, upper respiratory tract disease (especially bronchitis and sinusitis, asthmatic bronchitis, adult-onset asthma and acute exacerbations of asthma in adults.
                                                                                                                                                                                                                                                                                                Nucleic acids encoding polypeptide antigens from Chlamydia useful for preventing, diagnosing and treating diseases such as community acquired pneumonia, bronchitis, sinusitis and asthmatic bronchitis, adult-onset asthma
                                                                                                                                                                                                                                                                                                                                                                                                    Claim 16; Fig 3; 174pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            40
                                                                                                                                                                                                                                                          This polypeptide comprises the novel 96.7 kba surface exposed protein Omp9 of the human respiratory pathogen chlamydia protein Omp9 of the human respiratory pathogen chlamydia preumoniae. Its amino acid sequence was deduced from DNA (see AAX0681) isolated from a c. pneumoniae expression library. The AAX0681. Solated from a c. pneumoniae expression library. The invention provides 12 novel surface exposed proteins, Omp4-Omp15 (see AAX06816-27). A new species specific test is claimed that is used AAX06816-27). A new species specific test is claimed that is used to identify mammals (including humans) infected with chlamydia pneumoniae. The test comprises detecting antibodies specific for Omp4-Omp15 or detecting nucleic acid fragments encoding these outer in the diagnosis of c. pneumoniae infection in mammals. The nucleic acids and proteins can also be used in the immunization of mammals, the nucleic acids being particularly useful as DNA vaccines may also prevent atherosclerosis and bronchial asthma, which are possibly associated with C. pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ---aaaaatggtaatttttcagttcgtgagagtcaggaagatgct---ggaactacctac

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     97
This polypeptide is described as a subsequence of the claimed covel surface exposed protein CMD5 (see AAM88418) of Chlamydia pneumoniae, a human respiratory pathogen. The invention provides a new species aspecific test for identifying mammals (including antibodies specific test for identifying mammals (including antibodies specific for surface exposed proteins Omp4-Omp15 (see AAM88417-28) or detecting nucleic acid fragments encoding them (see CAAM88417-28) or detecting nucleic acid fragments encoding them (see diagnosis of C. pneumoniae infection in mammals. The nucleic acids and proteins can also be used in the immunization of mammals, the effecting in vivo expression of antigens. The vaccines for effecting in vivo expression of antigens. The vaccines may also prevent atherosclerosis and bronchial asthma, which are possibly associated with C. pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          -----AAGAAAGGCGGAGCCATTCAGACTTCCGATGCCCTTACCATTACTGGAAAC

This sequence is a chlamydia antigen of the invention, designated CPN100635. The nucleic acids (and their complementary sequences) may be used as diagnostic agents for detecting the presence of nucleic acids encoding Chlamydia antigens in samples according to standard methods, and therefore, for diagnosing Chlamydia infections. For example, they may be used as primers and probes for diagnostic polymerase chain reaction (PCR) assays. Antisense sequences may be used to down regulate expression of the proteins and may be used to treat infections. The nucleic acids may also be used to produce the protein antigens they encode according to standard recombinant DNA methodologies. The proteins may then be used as antigens for the production of antibodies (i.e. as vaccines) for preventing infection by Chlamydia. The antibodies may also be used as diagnostic reagents for detecting antibodies may also be used as diagnostic reagents for detecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acids encoding polypeptide antigens from Chlamydia useful for preventing, diagnosing and treating diseases such as community acquired pneumonia, bronchitis, sinusitis and asthmatic bronchitis, adult-onset
                                                                                                                                      Chlamydia antigen; diagnosis; infection; community acquired pneumonia; therapy; upper respiratory tract disease; bronchitis; sinusitis; asthma. asthmatic bronchitis; adult-onset asthma; acute exacerbations of asthma.
